

Category Service

Curl commands

Requires the service to be running on localhost and port 8080. When working on the cluster, ensure that you port-forward the service to 8080.

1.Create a category

```
curl -i -XPOST -H"Content-Type: application/json" localhost:8080/category -d{"id\n": \"100\", \"categoryName\": \"Transport\", \"description\": \"Taxi services\"}
```

2.Get a category by ID

```
curl -i localhost:8080/category/100
```

3.Update a category by ID

```
curl -i -XPUT -H"Content-Type: application/json" localhost:8080/category/100 -d{"id\n": \"100\", \"categoryName\": \"Transport\", \"description\": \"Paid Taxi services\n\"}
```

4.List all category

```
curl -i localhost:8080/category
```

5.Delete a page by ID

```
curl -i -XDELETE -H"Content-Type: application/json" localhost:8080/category/100
```
